Humla v0.3

Overview

- Long-polling and Streaming
- WebSocket Protocol
- WebRTC

Pushing and Polling

- Conceptual basis in messaging architectures
 - event-driven architectures (EDA)
- **HTTP is a request-response protocol**
 - response cannot be sent without request
 - server cannot initiate the communication
- **Polling** – client periodically checks for updates on the server
- **Pushing** – updates from the server (also called COMET)
 - = **long polling** – server holds the request for some time
 - = **streaming** – server sends updates without closing the socket

HTTP Long Polling

- Server holds long-poll requests
 - server responds when an event or a timeout occurs
 - saves computing resources at the server as well as network resources
 - can be applied over HTTP persistent and non-persistent communication
- Issues:
 - maximum time of the request processing at the server
 - concurrent requests processing at the server

HTTP Streaming

- server defers the response until an event or timeout is available
- when an event is available, server sends it back to client as part of the response; this does not terminate the connection
- server is able to send pieces of response w/o terminating the conn.
 - using **transfer-encoding** header in HTTP 1.1
 - using *End of File* in HTTP 1.0
 - (server omits **content-length** in the response)

Chunked Response

- Transfer encoding **chunked**
 - It allows to send multiple sets of data over a single connection
 - a chunk represents data for the event

```
1 HTTP/1.1 200 OK
2 Content-Type: text/plain
3 Transfer-Encoding: chunked
4
5 25
6 This is the data in the first chunk
7
8 1C
9 and this is the second one
10
11 0
```

- Each chunk starts with hexadecimal value for length
- End of response is marked with the chunk length of 0

- Steps:
 - server sends HTTP headers and the first chunk (step 3)
 - server sends second and subsequent chunk of data (step 4)
 - server terminates the connection (step 5)

Issues with Chunked Response

- Chunks vs. Events
 - *chunks cannot be considered as app messages (events)*
 - *intermediaries might "re-chunk" the message stream*
 - *e.g., combining different chunks into a longer one*
- Client Buffering
 - *clients may buffer all data chunks before they make the response available to the client application*
- HTTP streaming in browsers
 - *Server-sent events*

Server-Sent Events

- W3C specification
 - *part of HTML5 specs, see Server-Sent Events [🔗](#)*
 - *API to handle HTTP streaming in browsers by using DOM events*
 - *transparent to underlying HTTP streaming mechanism*
 - *can use both chunked messages and EOF*
 - *same origin policy applies*
- **EventSource** interface
 - *event handlers: **onopen**, **onmessage**, **onerror***
 - *constructor **EventSource(url)** – creates and opens the stream*
 - *method **close()** – closes the connection*
 - *attribute **readyState***
 - **CONNECTING** – *The connection has not yet been established, or it was closed and the user agent is reconnecting.*
 - **OPEN** – *The user agent has an open connection and is dispatching events as it receives them.*
 - **CLOSED** – *The conn. is not open, the user agent is not reconnecting.*

Example

- Initiating **EventSource**

```
1 | if (window.EventSource != null) {  
2 |   var source = new EventSource('your_event_stream.php');  
3 | } else {  
4 |   // Result to xhr polling :(  
5 | }
```

- Defining event handlers

```
1 | source.addEventListener('message', function(e) {  
2 |   // fires when new event occurs, e.data contains the event data  
3 | }, false);  
4 |  
5 | source.addEventListener('open', function(e) {  
6 |   // Connection was opened  
7 | }, false);  
8 |  
9 | source.addEventListener('error', function(e) {  
10 |   if (e.readyState == EventSource.CLOSED) {  
11 |     // Connection was closed  
12 |   }  
13 | }, false);
```

- *when the conn. is closed, the browser reconnects every ~3 seconds*
→ can be changed using **retry** attribute in the message data

Event Stream Format

- Format

- response's **content-type** must be **text/event-stream**
- every line starts with **data:**, event message terminates with 2 **\n** chars.
- every message may have associated **id** (is optional)

```
1 | id: 12345\n  
2 | data: first line\n  
3 | data: second line\n\n
```

- JSON data in multiple lines of the message

```
1 | data: {\n  
2 |   data: "msg": "hello world",\n  
3 |   data: "id": 12345\n  
4 | data: }\n\n
```

- Changing the reconnection time

- *default is 3 seconds*

```
1 | retry: 10000\n  
2 | data: hello world\n\n
```

Server-side implementation

- Java Servlet
 - *method doGet*

```
1 public void doGet(HttpServletRequest req, HttpServletResponse resp)
2     throws IOException {
3
4     // set http headers
5     resp.setContentType("text/event-stream");
6     resp.setHeader("cache-control", "no-cache");
7
8     // current time in milliseconds
9     long ms = System.currentTimeMillis();
10
11    // push data to the client for 20 seconds
12    // client should reconnect when the connection is closed
13    while (System.currentTimeMillis() - ms < 20000) {
14        resp.getWriter().print("data: servlet runs for " +
15                               (System.currentTimeMillis() - ms)/1000 + " seconds.\n\n");
16        resp.getWriter().flush();
17        try {
18            Thread.sleep(4000);
19        } catch (InterruptedException e) {
20            // do nothing;
21        }
22    }
23 }
```

Other Technologies

- Cross-document messaging

- *The use of Cross Document Messaging for streaming*
 1. The client loads a streaming resource in a hidden **iframe**
 2. The server pushes a JavaScript code to the **iframe**
 3. The browser executes the code as it arrives from the server
 4. The embedded iframe's code posts a message to the upper document

Overview

- Long-polling and Streaming
- **WebSocket Protocol**
- WebRTC

WebSocket

- Specifications
 - IETF defines *WebSocket Protocol* [↗](#)
 - W3C defines *WebSocket API* [↗](#)
- Design principles
 - *a new protocol*
 - *browsers, web servers, and proxy servers need to support it*
 - *a layer on top of TCP*
 - *bi-directional communication between client and servers*
 - *low-latency apps without HTTP overhead*
 - *Web origin-based security model for browsers*
 - *same origin policy, cross-origin resource sharing*
 - *support multiple server-side endpoints*
- Two phases
 - *Handshake* – as an **upgrade** of a HTTP connection
 - *data transfer* – the protocol-specific on-the-wire data transfer

Handshake – Request

- Request

- client sends a following HTTP request to upgrade the connection to WebSocket

```
1 GET /chat HTTP/1.1
2 Host: server.example.com
3 Upgrade: websocket
4 Connection: Upgrade
5 Sec-WebSocket-Key: dGhlIHNhbXBsZSBub25jZQ==
6 Sec-WebSocket-Origin: http://example.com
7 Sec-WebSocket-Protocol: chat, superchat
8 Sec-WebSocket-Version: 7
```

- **Connection** – request to upgrade the protocol
 - **Upgrade** – protocol to upgrade to
 - **Sec-WebSocket-Key** – a client key for later validation
 - **Sec-WebSocket-Origin** – origin of the request
 - **Sec-WebSocket-Protocol** – list of sub-protocols that client supports (proprietary)

Handshake – Response

- Response

- server accepts the request and responds as follows

```
1 HTTP/1.1 101 Switching Protocols
2 Upgrade: websocket
3 Connection: Upgrade
4 Sec-WebSocket-Accept: s3pPLMBiTxaQ9kYGzzhZRbK+x0o=
5 Sec-WebSocket-Protocol: chat
```

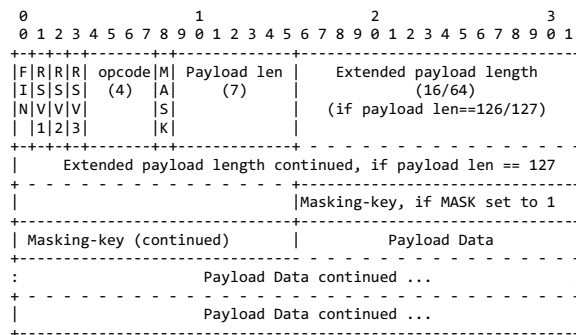

- **101 Switching Protocols** – status code for a successful upgrade
 - **Sec-WebSocket-Protocol** – a sub-protocol that the server selected from the list of protocols in the request
 - **Sec-WebSocket-Accept** – a key to prove it has received a client WebSocket handshake request
- Formula to compute **Sec-WebSocket-Accept**

```
1 Sec-WebSocket-Accept = Base64Encode(SHA-1(Sec-WebSocket-Key +
2 "258EAF5-E914-47DA-95CA-C5AB0DC85B11"))
```

- **SHA-1** – hashing function
 - **Base64Encode** – Base64 encoding function
 - **"258EAF5-E914-47DA-95CA-C5AB0DC85B11"** – magic number

Data Transfer

- After successful handshake
 - socket between the client and the "resource" at the server is established
 - client and the server can both read and write from/to the socket
 - No HTTP headers overhead
- Data Framing
 - Data transmitted in TCP packets (see RFC6455: Base Framing Protocol [↗](#))
 - Contains payload length, closing frame, ping, pong, type of data (text/binary), etc. and payload (message data)

WebSocket API

- Client-side API
 - clients to utilize WebSocket, supported by Chrome, Safari
 - Hides complexity of WebSocket protocol for the developer
- JavaScript example

```

1 // ws is a new URL schema for WebSocket protocol; 'chat' is a sub-protocol
2 var connection = new WebSocket('ws://server.example.org/chat', 'chat');
3
4 // When the connection is open, send some data to the server
5 connection.onopen = function () {
6   // connection.protocol contains sub-protocol selected by the server
7   console.log('subprotocol is: ' + connection.protocol);
8   connection.send('data');
9 };
10
11 // Log errors
12 connection.onerror = function (error) {
13   console.log('WebSocket Error ' + error);
14 };
15
16 // Log messages from the server
17 connection.onmessage = function (e) {
18   console.log('Server: ' + e.data);
19 };
20
21 ...
22
23 // closes the connection
24 connection.close()

```

Sockets.IO

- Many options for streaming
 - *long-polling, streaming, iframe, WebSockets*
 - *Not all browsers support WebSockets*
 - *Socket.IO* [↗](#) – *a layer providing a unified API*
- Sockets.IO
 - *API and JavaScript implementation*
 - *checks the availability of WebSocket protocol*
 - *fallback to long-polling or other technologies when not available*

```
1  // creates a new socket
2  var socket = new io.Socket();
3
4  // event handlers
5  socket.on('connect', function(){
6      socket.send('hi!');
7  })
8  socket.on('message', function(data){
9      alert(data);
10 })
11 socket.on('disconnect', function({}))
```

Overview

- Long-polling and Streaming
- WebSocket Protocol
- WebRTC

WebRTC

- Web Real-Time Communication
 - *API to exchange media and arbitrary data between peers inside Web pages*
 - *It uses peer-to-peer principles*
 - *Supported by Google, Mozilla, Microsoft, Opera*
- Specifications
 - *WebRTC IETF Working Groups* [🔗](#)
 - *WebRTC W3C Working Groups* [🔗](#)
- History
 - *Google acquires company Global IP Solutions (GIPS) in 2010*
 - *GIPS developed underlying technology (codecs, echo cancellation techniques), released as open source*
 - *Google promoted the work around GIPS to W3C and IETF*

WebRTC Main Tasks

- Acquiring audio and video
 - *JavaScript API: **MediaStream** (aka `getUserMedia`)*
- Communicating audio and video
 - *JavaScript API: **RTCPeerConnection***
- Communicating arbitrary data
 - *JavaScript API: **RTCDataChannel***

getUserMedia

- JavaScript code

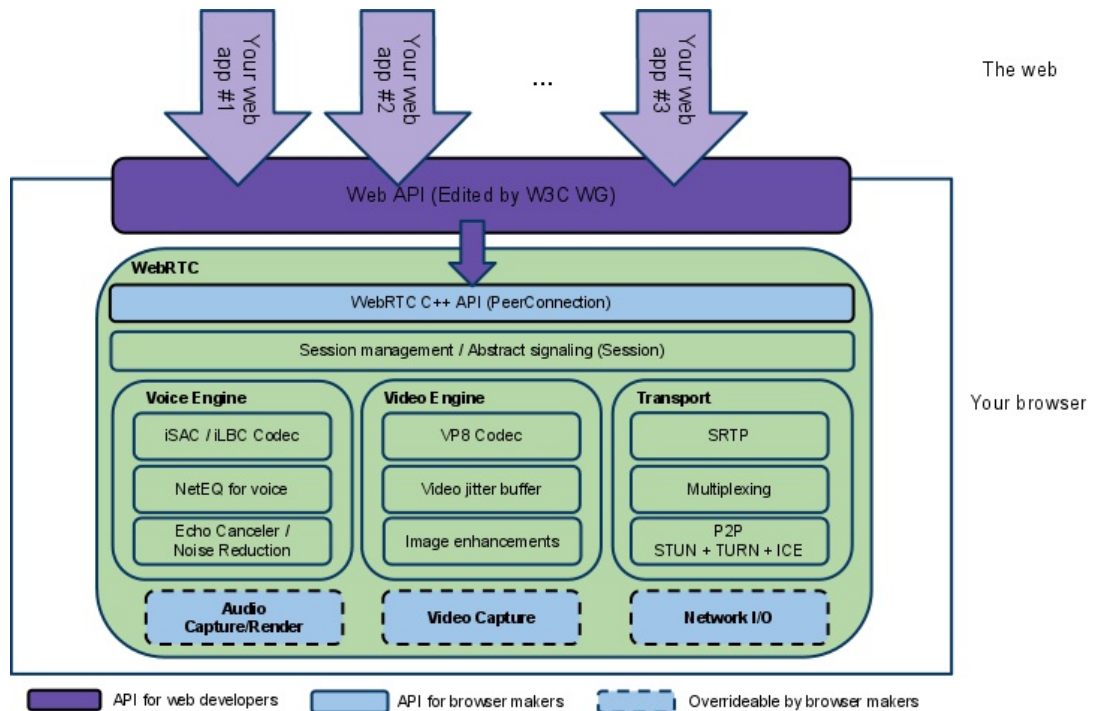

```
1  var constraints = {video: true};
2
3  function successCallback(stream) {
4      var video = document.querySelector("video");
5      video.src = window.URL.createObjectURL(stream);
6  }
7
8  function errorCallback(error) {
9      console.log("navigator.getUserMedia error: ", error);
10 }
11
12 navigator.getUserMedia(constraints, successCallback, errorCallback);
13
```

- Constraints
 - Control the contents of the *MediaStream*
 - Media type, resolution, frame rate
- JavaScript app can read and manipulate the stream.
- It is also possible to acquire **audio** as well as **screen capture**.

RTCPeerConnection

- Allows to communicate media stream acquired by **getUserMedia**
 - Video chat, audio chat, screen sharing
- Some capabilities of **RTCPeerConnection**
 - Signal processing
 - Code handling
 - Peer to peer communication
 - Security
 - Bandwidth management

WebRTC Architecture

Communication

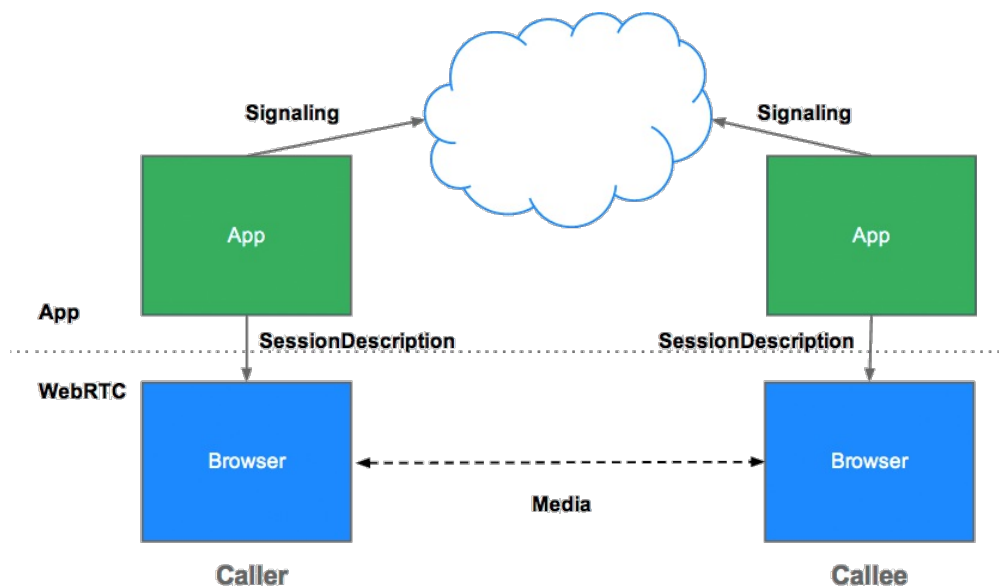

- Two phases
 1. **Signaling**
 - WebRTC defines **abstract signalling**
 - apps can use any signaling protocol, can use any such as SIP, XMPP, or custom using XHR or Websockets
 2. **Exchange of real-time data in peer-to-peer manner**
- Abstract signaling
 - Need to exchange **session description** objects
 - Formats, codecs the peers want to use
 - Network information for peer-to-peer communication
 - This information is captured as **RTCSessionDescription** (also SDP) structure
 - Any messaging mechanism and protocol

SIP and SDP

- Standards
 - SIP – Session Initiation Protocol, protocol to establish and modify sessions.
 - SDP – Session Description Protocol, describes media for a session, defined in RFC4566 - Session Description Protocol [🔗](#)
- SDP Example

```
v=0
o=- 7614219274584779017 2 IN IP4 127.0.0.1
s=-
t=0 0

a=mid:audio
a=rtcp-mux
a=crypto:1 AES_CM_128_HMAC_SHA1_80 inline:9c1AHz27dZ9xPI91YNfS1I67/EMkjHHIHORiClQe
a=rtpmap:111 opus/48000/2
...
```

Signaling Diagram

JavaScript Session Establishment (JSEP)

- JSEP is a protocol to create a session between two parties
- JSEP steps between Alice and Bob
 1. Alice creates an offer that contains her local SDP.
 2. Alice attaches that offer to `RTCPeerConnection` object.
 3. Alice sends the offer to a signaling server using custom-built mechanism (`WebSocket`, `XHR`, etc.)
 4. Bob receives Alice's offer from the signaling server
 5. Bob creates an answer using his local SDP.
 6. Bob attaches his answer along with Alice's offer to his own `RTCPeerConnection` object.
 7. Bob returns his answer to the signaling server.
 8. Alice receives Bob's offer from the signaling server.

Interactive Connectivity Establishment

- ICE – Interactive Connectivity Establishment
 - Allows WebRTC to overcome complexities of real-world networking
 - Finds the best path to connect peers such as
 - direct P2P communication.
 - by using STUN or TURN servers.
- STUN – Session Traversal Utilities for NAT
 - Allows to discover the presence of a NAT server:
 - Allows to discover the public IP address and a port that the NAT has allocated for UDP flows.
 - It is provided as a third-party network server (STUN server) located on the public side of the NAT.
- TURN – Traversal Using Relays around NAT
 - Communication relay for hosts behind NAT when STUN does not work.
