# **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service

# **Terminology**

- Cloud computing
- \*aaS
- DevOps
- Cloud Native, Microservices
- Serverless

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 3 -

### What is a Cloud?

- A different way of thinking
  - Got your grand mum's savings under your pillow?
    - → probably not, you better have them in your bank
  - Data is your major asset
  - you better have them in a "bank" too
  - Someone can abuse your data?
  - banks bankrupt too, sometimes it is a risk you take
  - there is a market and a competition
- Outsourcing of application infrastructure
  - Reliability and availability
  - Low costs pay-per-use
  - Elasticity can dynamically grow with your apps
  - CAPEX vs. OPEX

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 4 -

### What is a Cloud?

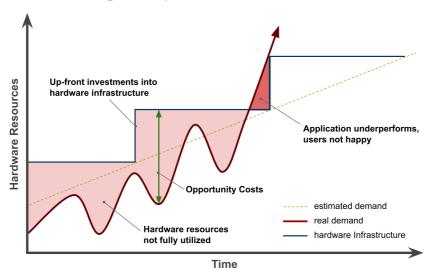

- Any app you access over the web?
- A datacenter?
  - Offers virtualization
  - Any company having a datacenter wants to move to
- Cloud provider should also offer services, such as:
  - scalability, storage
  - Possible to configure programmatically
    - → integration to enterprise administration processes
    - $\rightarrow$  usually REST interface

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 5 -

### **Traditional Solution to Infrastructure**

- Traditional hardware model
  - *Up-front hardware investments*
  - Hardware not optimally utilized

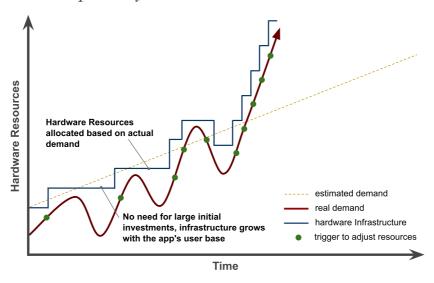

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

## **Good Performance - Cloud Solution**

# • Cloud Computing model

- No up-front hardware investments
- Hardware optimally utilized

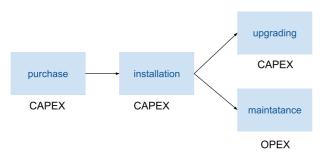

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

-7-

#### CAPEX vs. OPEX

- Captial expenditure/capital expense (CAPEX)
  - money to spend to buy, maintain or improve fixed assets
    - $\rightarrow$  buildings, vehicels, equipment or land
  - have impact on costs vs. profit and tax

- Operational expenditure (OPEX)
  - ongoing costs for running a product, business, or systems
  - *OPEX* are entirely tax-deductible
- Cloud lets you trade CAPEX for OPEX
  - No investments in data centers and infrastructures
  - You pay only when you consume resources

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

# **Cloud Computing Concepts**

#### • On-demand and self-service

- Resources are provisioned as they are requested and when they are required
- No human interaction, automatic

#### Broad network access

- Capabilities are available over the network

#### • Resource pooling

- Provider's computing resources reused by multiple tenants (multitenancy)
- Resourcces are dynamically assigned/re-assigned according to demand
- Computing resources: CPU, memory, storage, network

#### • Scalability and elasticity

- Infrastructure may grow and shrink according to needs
- Automatic or manual

#### Measured service

- Resource usage can be monitored, controlled and reported

#### Pay-per-use

- Consumers only pay for resources when they use them

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 9 -

# **Cloud Computing Concepts (Cont.)**

## • Service Models (aka Cloud Layers)

- IaaS Infrastructure as a Service
- PaaS Platform as a Service, Serverless
  - $\rightarrow$  MWaaS, DBaaS, ...
  - $\rightarrow$  FaaS
- SaaS Software as a Service

## Deployment Models

- Public Cloud
- Private Cloud
- Hybrid Cloud

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

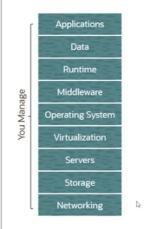

– 10 –

- Introduction
- Cloud Architecture
  - Service Models
  - Multitenancy
- Infrastructure as a Service

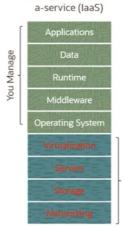

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 11 –

# **Service Models**

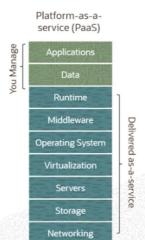

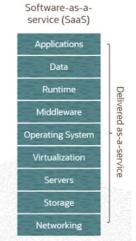

Traditional IT

Delivered as-a-service

Infrastructure-as-

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

\_ 12 -

### IaaS: Infrastructure as a Service

#### Usage

- Predefined shapes of compute instances (e.g. micro, small, large, extra-large) → for example: RedHat 7.8, 613 MB of memory, 1 TB block storage
- Pay-per-use pay for resources you use (time or amount) → no up-front costs

#### IaaS Services Examples

- Load balancer
- Autoscaling
- Connectivity with on-premise network
- Resource monitoring

#### IaaS providers

- Amazon EC2, GoGrid, Rackspace, OpenNebula, Google Cloud, Oracle OCI, ...

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

### PaaS: Platform as a Service

#### Usage

- Choose software platform, e.g., JEE, .NET, Python, etc.
- Pay-per-use pay for the resources you use; no up-front costs
- Cloud native, microservices, containers

#### PaaS features

- Serverless
- Auto Scalling and Load balancing
- Local development environment
- Administration API

### PaaS providers

- Google App Engine first PaaS service
- Today, mostly Kubernetes, Google, Heroku, Azure, AWS, Oracle

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

# SaaS: Software as a Service

- Software delivery model for applications hosted in the cloud
  - typically software for end-users
  - services accessed using a web browser
  - provides API for programmatic access
- SaaS characteristics
  - Typically build on top of IaaS or PaaS
  - Configurable and customizable modern Web applications
  - Usually basic version for free, need to pay for "pro" version
  - Global availability any computer, any device
  - Easy management automatic and fast updates
  - Pay-per-use pay for the time you use
- SaaS providers
  - Google Apps, Salesforce, ...

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 15 -

### **Overview**

- Introduction
- Cloud Architecture
  - Service Models
  - Multitenancy
- Infrastructure as a Service

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 16 -

# **Multitenancy**

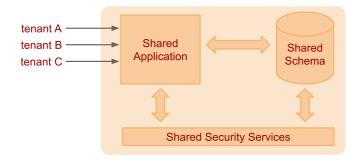

- Architectural approach where resources are shared between multiple tenants or consumers
- Implications
  - Centralization of infrastructure in locations with lower costs
  - Peak-load capacity increases
  - Utilisation and efficiency improvements for systems that are not well utilised
- Sharing options
  - Shared Everything
  - Shared Infrastructure
    - → Virtual Machines
    - → OS "virtualization"

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

\_ 17 \_

# **Shared Everything**

- Resources are shared between all tenants or consumers
  - tenant: a service consumer
- Common for the SaaS model
- The application should provide tenant isolation
- Data for multiple tenants is stored in the same database tables

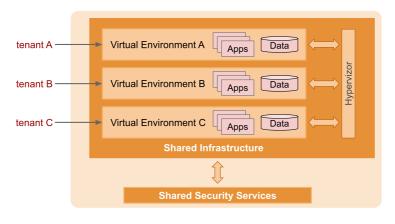

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

### **Shared Infrastructure: Virtual Machines**

#### • Infrastructure shared via virtual machines

- each tenant has its own virtual environment
- Isolation provided by hypervisor
  - → hypervisor: virtual machine manager, runs virtual machines
- Resource contention depends on VM capability and configuration
- Adds an additional layer and processes to run and manage

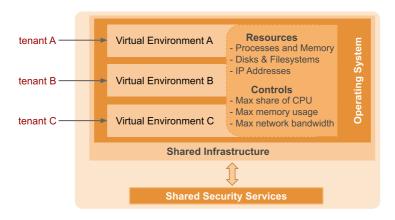

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

**-** 19 -

#### **Shared Infrastructure: OS Virtualization**

#### • Infrastructure shared via OS Virtualization

- Each tenant has its own processing zone
- Isolation provided by the operating system
- Resource contention depends on zone configuration
- No VMs to run and manage, no abstraction layer between app & OS

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Networking
  - Compute
  - Storage
  - Infrastructure as Code

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 21

### **Overview**

- Infrastructure = environment where your app is running
- Tenancy = your "space" in the cloud
- What you need
  - Servers (compute instances) to run your app in a location (region)
  - Connectivity
    - → Private network for intra-communication
    - $\rightarrow$  Public network for internet communication
    - $\rightarrow$  Firewall (security) rules
    - $\rightarrow$  Route tables
  - Storage
    - $\rightarrow$  Operating system
    - $\rightarrow$  Your app data
  - Identity Management
    - → Who and how can access and control your tenancy
  - Monitoring, Logging, Auditing

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 22 -

# Region

• Region = location on a planet where cloud data centers are located

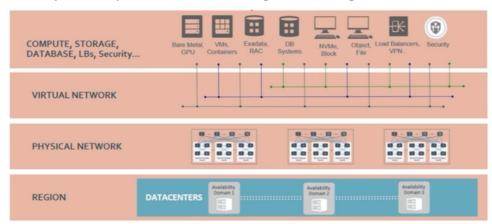

- Why location matters...
  - Latency your users should be close to your app
  - Regulations your data should be stored in EU
  - Connectivity to external providers
    - → Such as other cloud vendors

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 23 -

#### **Datacenters**

- Datacenter (aka Availability Domain AD)
  - Computing resources in a location within a region
  - One or more datacenters exsit in a region
    - → They are completely de-correlated, independent
    - → They have separated power supply, do not share underlying infrastructure
    - $\rightarrow$  If one DC fails, the other one is up and running

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

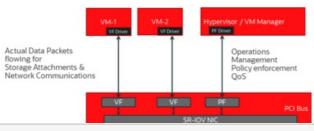

- 24 -

### **Off-box Network Virtualization**

- Gen 1.0 Cloud, inefficient Resource Sharing
  - On-Premise virtualization to share resources amongst multiple tenants in the cloud.

- Gen 2.0 Cloud
  - Smart-NIC accelerated SR-IOV (Single Root I/O Virtualization)
    - → Networking is a specialized function, needs hardware/sillicon to accelerate it

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 25 -

### **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Networking
  - Compute
  - Storage
  - Infrastructure as Code

#### Virtual Cloud Network

- VCN = a private network in a **single region** in which your instances reside
- A a single and contigous IPV4 CIDR block of your choice
  - CIDR (classless inter-domain routing) notation
  - *IP address*:
    - → network prefix (the most significant bits) and
    - → interfaces on the network (least significant bits) ~ network hosts
  - Example: 192.168.1.0/24
    - $\rightarrow$  IP range: 192.168.1.0 192.168.1.255
- You further create subnets on a VCN to organize your instances
  - The subnets must be "within" the VCN, they can span across ADs
  - Example: using 27 bits for a subnet mask allow for 8 subnets
    - → 192.168.1.0/27, 192.168.1.32/27, 192.168.1.64/27, ...
    - → Each subnet can have 32 hosts

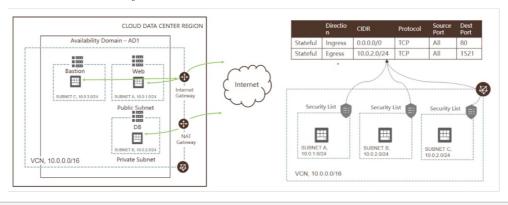

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 27 –

# **VCN Routing and Security**

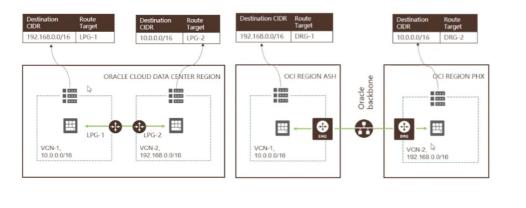

- Private and Public subnets
  - Public can communicate in/out from/to Internet
  - Internet traffic routed to public subnet
  - Private can be completely isolated or communicate to Internet only
- Route tables
  - Required to route across subnets and in/out from the Internet
- Security
  - Control access to/from the subnet

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

# **Peering**

- Local Peering
  - Connecting two VCNs in a region
- Remote Peering
  - Connecting two VCNs across regions
- Connectivity with on-premise datacenter
  - Fast connection needs to be in place
  - Secure VPN needs to be established

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 29 -

## **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Networking
  - Compute
  - Storage
  - Infrastructure as Code

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 30 –

# **Compute Instances**

- Shape = amount of memory and CPU an instance is using
  - There are classes of shapes that you can choose from
  - Standard and HPC/GPU shapes
- Virtual Machine (VM) multi-tenant model
  - A hypervisor to virtualize the underlying Bare Metal server into smaller VMs
- Bare Metal (BM) single-tenant model
  - Direct hardware access, full bare metal server
  - Types of workloads: performance intensive, require a specific hypervisor
- Dedicated VM Hosts (DVM) single-tenant model
  - VM instances running on dedicated single-tenant servers
  - Not shared with other customers

- States: start, stop, reboot, terminate
  - Billing pauses in STOP state but depends on shape

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 31 -

# **Image**

- Image
  - A template of a virtual hard drive with OS
  - Other software, libraries, configurations, etc.
- Stored on a boot volume
- Base images are provided
  - CentOS, Ubuntu, Windows Server, Oracle Linux, RedHat, etc.
  - Some may require licence costs
- Custom images
  - You can create a custom image from the base image
  - Specific packages, libraries or custom configuiration
  - You store the image in the object storage

# Autoscaling

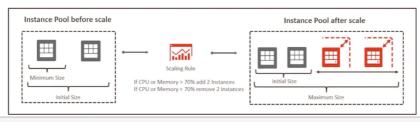

#### • Instance configuration

- OS image, metadata, shape, vNICs, storage, subnets
- Apply configuration to multiple instances at the same time
  - → You can manage them all together (start, stop, terminate)

#### Autoscaling

- Automatically adjust a number of compute instances in an instance pool
- Control using performance metrics such CPU or memory utilization
- cooldown period time between scale in and scale out (e.g. 300 seconds)

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 33 -

#### **Load Balancer**

#### • Managed service

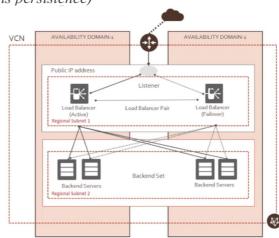

- Health check checks health status of backends (TCP, HTTP)
- Algorithm round-robin, IP hash, least connections

#### • Supports protocols

- TCP, HTTP 1.1, HTTP/2, WebSocket, SSL termination, end-to-end SSL
- Supports sticky sessions (sessions persistence)

### • High Availability

- Primary and stand-by LB
- Each LB is in different AD
- Failover uses floating IP

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Networking
  - Compute
  - Storage
  - Infrastructure as Code

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 35 -

# **Object Storage**

- Types of data to store
  - Storage for unstructured data (images, media files, logs, backups)
  - Data managed as objects, provides API using HTTP verbs
- Namespace
  - Logical entity that serves as top-level container for all bueckts and objects
  - Each tenancy is provided one unique namespace
- Bucket
  - A logical container for storing objects
  - Bucket names must be unique within tenancy
  - Hot bucket standard, can be accessed immediatelly
  - Cold bucket rarely accessed data, need to be restored
    - → Minimum retention, such as 90 days
    - $\rightarrow$  Time to First Byte (TTFB) is in hours, e.g. 4 hours
- Object and metadata
  - data managed as objects regardless data type
- Example object URL path:

/n/<namespace>/b/<bucket>/o/<object\_name>

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

# **Block Storage**

- Local NVMe SSD device
  - Locally attached device, provided by some shapes, 200K IOPS 1M IOPS
  - Workloads that require high storage performance
  - usually no RAID, snapshots, backups
- Block volumes
  - Reside in storage servers
  - NVMe SSD based, up to 35K IOPS
  - Data stored on block volumes beyond the lifespan of compute instance
  - Multiple replicas across multiple storage servers
- File Storage
  - Network file server (NFS)
  - Client mounts a mount target (NFS endpoint) and an export path
  - Example

sudo mount 10.0.0.6/example1/path /mnt/mountpointA

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 37 -

## **Overview**

- Introduction
- Cloud Architecture
- Infrastructure as a Service
  - Networking
  - Compute
  - Storage
  - Infrastructure as Code

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

– 38 –

- Definition
  - Application envs (in a cloud) managed via definition files
  - Version control, team development, scripting, etc.
- Major Technologies
  - Configuration Management Tools
    - → install and manage software on machines that already exist
    - → Examples: Ansible, Chef, Puppet
  - Abstraction of cloud infrastructure
    - $\rightarrow$  Terraform

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar

- 39

### **Terraform**

- Higher-level abstraction of the datacenter and associated services
- Supports many service providers
  - Google, Microsoft, Oracle, AWS
- Steps
  - 1. Description of resources in Hashicorp Configuration Language (HCL) instances, networks, firewall rules, routing tables, etc.
  - 2. Terraform generates execution plan to reach the desired state
  - 3. Terraform executes the plan to reach the desired state; can generate incremental execution plan

Lecture 5: Cloud Architectures, CTU Summer Semester 2024/2025, @TomasVitvar
