# **Overview**

- Introduction
- Infrastructure as a Service
- Multitenancy
- Microservices Architecture
- Docker
- Kubernetes

## **Traditional Solution to Infrastructure**

- Traditional hardware model
  - *Up-front hardware investments*
  - Hardware not optimally utilized

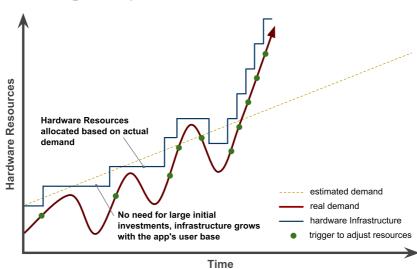

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 3 -

# **Good Performance – Cloud Solution**

- Cloud Computing model
  - No up-front hardware investments
  - Hardware optimally utilized

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 4

# **Cloud Computing Concepts**

#### Resource Pooling

- Resources reused by multiple tenants (multitenancy)
- Resources: CPU, memory, storage, network

#### On-demand and Self-service

- Resources are provisioned as they are requested and when they are required
- No human interaction, automatic

#### Scalability and Elasticity

- Infrastructure may grow and shrink according to needs
- Automatic or manual

## • Pay-per-use

- Consumers only pay for resources when they use them

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 5 -

# **Cloud Service Concepts**

## • Service Models (aka Cloud Layers)

- IaaS Infrastructure as a Service
- PaaS Platform as a Service
  - → MWaaS, DBaaS, ...
- SaaS Software as a Service

## Deployment Models

- Public Cloud
- Private Cloud
- Hybrid Cloud

# Usage

- Cloud native applications
- Moving existing applications from on-premise to cloud

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 6 -

- Introduction
- Infrastructure as a Service
  - Infrastructure as Code
- Multitenancy
- Microservices Architecture
- Docker
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

-7-

# Terminology (1)

- Region
  - A localized geographical area
  - A cloud provider usually has multiple regions around the world.
- Availability Domain
  - A datacenter in a region; there can be more AD in a region
- Tenancy
  - Isolated partition where a customer creates and organizes cloud resources.
- Instance
  - Compute host running in the cloud
- Bare Metal
  - Physical host that run directly on bare metal servers without hypervisor
- Shape/Class
  - Amount of computing resources allocated to the instance
  - CPUs, Memory, Local Disk, Network Bandwidth, Number of VNICs
- Image
  - A template of a virtual hard drive that defines operating system and other software for an instance.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 8

# Terminology (2)

- Instance Pool
  - A group of instances
- Virtual Cloud Network (VCN)
  - A virtual network in which instances run
  - It includes: subnets, route tables, firewall rules, gateways
- Block Volume
  - A virtual disk providing persistent storage
  - It can be used as a volume attached to the instance
- Object Storage
  - Allows to store and manage data as objects in logical containers (buckets)
  - The data can be of any type and are usually of large size
  - The data does not change frequently
  - Examples: data backup, storing unstructured data, sensor-generated data

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 9 -

# **Access and Usage**

- Layers
  - Cloud Infrastructure  $\rightarrow$  REST API  $\rightarrow$  CLI, Web Console, other tools
- Key pair
  - Authentication mechanism using **public** and **private** key
  - public key is uploaded to an instance, a client uses the private key to authenticate
  - Example: ssh using key authentication to access ssh deamon running in Linux

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 10 –

# AVAILABILITY DOMAIN 1 PUBLIC SUBNET 10.1.20.0/24 PRIVATE SUBNET 10.1.10.0/24 MEMCACHED VM INSTANCE POOL PRIVATE SUBNET 10.1.11.0/24 VCN: 10.1.0.0/16 REGION

# **Overview**

- Introduction
- Infrastructure as a Service

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- Infrastructure as Code
- Multitenancy
- Microservices Architecture
- Docker
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 12 -

- Definition
  - Application envs (in a cloud) managed via definition files
  - Version control, team development, scripting, etc.
- Major Technologies
  - Configuration Management Tools
    - → install and manage software on machines that already exist
    - → Examples: Ansible, Chef, Puppet
  - Abstraction of cloud infrastructure
    - $\rightarrow$  Terraform

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 13 -

## **Terraform**

- Higher-level abstraction of the datacenter and associated services
- Supports many service providers
  - Google, Microsoft, Oracle, AWS
- Steps
  - 1. Description of resources in Hashicorp Configuration Language (HCL) instances, networks, firewall rules, routing tables, etc.
  - 2. Terraform generates execution plan to reach the desired state
  - 3. Terraform executes the plan to reach the desired state; can generate incremental execution plan

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 14 -

- Introduction
- Infrastructure as a Service
- Multitenancy
- Microservices Architecture
- Docker
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 15 -

# **Multitenancy**

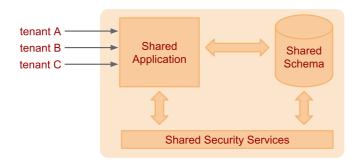

- Architectural approach where resources are shared between multiple tenants or consumers
- Implications
  - Centralization of infrastructure in locations with lower costs
  - Peak-load capacity increases
  - Utilisation and efficiency improvements for systems that are not well utilised
- Sharing options
  - Shared Everything
  - Shared Infrastructure
    - → Virtual Machines
    - $\rightarrow$  O/S virtualization

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 16 -

# **Shared Everything**

- Resources are shared between all tenants or consumers
  - tenant: a service consumer
- Common for the SaaS model
- The application should provide tenant isolation
- Data for multiple tenants is stored in the same database tables

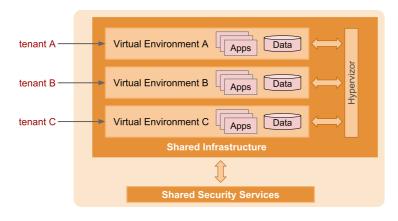

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 17 -

## **Shared Infrastructure: Virtual Machines**

- Infrastructure shared via virtual machines
  - each tenant has its own virtual environment
  - Isolation provided by hypervisor
    - → hypervisor: virtual machine manager, runs virtual machines
  - Resource contention depends on VM capability and configuration
  - Adds an additional layer and processes to run and manage

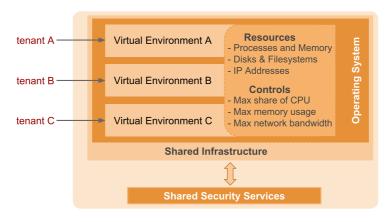

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 18 -

## **Shared Infrastructure: OS Virtualization**

- Infrastructure shared via OS Virtualization
  - Each tenant has its own processing zone
  - Isolation provided by the operating system
  - Resource contention depends on zone configuration
  - No VMs to run and manage, no abstraction layer between app & OS

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 19 \_

## **Overview**

- Introduction
- Infrastructure as a Service
- Multitenancy
- Microservices Architecture
- Docker
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 20 -

- Emerging software architecture
  - monolithic vs. decoupled applications
  - applications as independenly deployable services

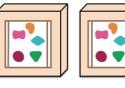

A monolithic application puts all its functionality into a single process...

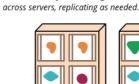

A microservices architecture puts each element of functionality into a separate service...

... and scales by replicating the monolith on multiple servers

... and scales by distributing these services

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 21 -

# **Major Characteristics**

- Loosely coupled
  - Integrated using well-defined interfaces
- Technology-agnostic protocols
  - HTTP, they use REST architecture
- Independently deployable and easy to replace
  - A change in small part requires to redeploy only that part
- Organized around capabilities
  - such as accounting, billing, recommendation, etc.
- Impplemented using different technologies
  - polyglot programming languages, databases

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

\_ 22 -

- Introduction
- Infrastructure as a Service
- Multitenancy
- Microservices Architecture
- Docker
  - Overview
  - Image Layering
  - Working with Docker
  - Swarm
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 23

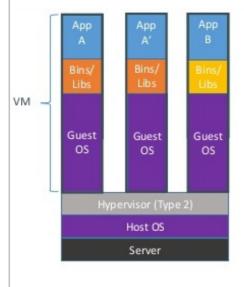

## **Overview**

- Linux Containers
  - Introduced in 2008
  - Allow to run a process tree in a isolated system-level "virtualization"
  - Use much less resources and disk space than traditional virtualization
- Implementations
  - $-LXC-default\ implementation\ in\ Linux$
  - Docker Containers
    - → Builds on new Kernel features: control groups (cgroups), kernel namespaces, union-capable file system (OverlayFS, AUFS, etc.)
    - $\rightarrow$  A way to build, commit and share images
    - ightarrow Build images using a description file called Dockerfile
    - → I arao numbor of available hase and re-usable images

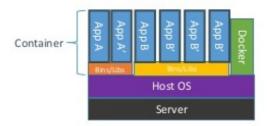

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 24 -

## VM vs. Docker Containers

Containers are isolated, but share OS and, where appropriate, bins/libraries

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 25 -

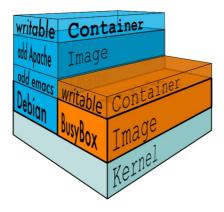

## **Docker Basic Terms**

- Image
  - Bssis for containers.
  - An image contains a union of layered filesystems stacked on top of each other.
  - An image does not have state and it never changes.
- Container
  - A runtime instance of a Docker image, a standard to "ship software".
- Docker Engine
  - The core process providing the Docker capabilities on a host.
- Docker Client
  - Interface that integrates with docker engine.
- Registry
  - A hosted service containing repository of images.
  - A registry provides a registry API to search, pull and push images.
  - Docker Hub is the default Docker registry.
- Swarm
  - A cluster of one or more docker engines.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 26

# **Docker Images**

- Containers are made up of R/O layers via a storage driver (OverlayFS, AUFS, etc.)
- Containers are designed to support a single application
- Instances are ephemeral, persistent data is stored in bind mounts or data volume containers.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 27

## **Overview**

- Introduction
- Infrastructure as a Service
- Multitenancy
- Microservices Architecture
- Docker
  - Overview
  - Image Layering
  - Working with Docker
  - Swarm
- Kubernetes

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 28 –

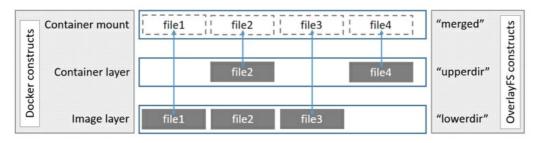

# **Image Layering with OverlayFS**

#### OverlayFS

- A filesystem service implementing a **union mount** for other file systems.
- Docker uses overlay and overlay2 storage drivers to build and manage ondisk structures of images and containers.

#### • Image Layering

- OverlayFS takes two directories on a single Linux host, layers one on top of the other, and provides a single unified view.
- Only works for two layers, in multi-layered images hard links are used to reference data shared with lower layers.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 29 -

# **Image Layers Example**

Pulling out the image from the registry

```
$ sudo docker pull ubuntu

Using default tag: latest
latest: Pulling from library/ubuntu

5ba4f30e5bea: Pull complete
9d7d19c9dc56: Pull complete
ac6ad7efd0f9: Pull complete
e7491a747824: Pull complete
a3ed95caeb02: Pull complete
Digest: sha256:46fb5d001b88ad904c5c732b086b596b92cfb4a4840a3abd0e35dbb6870585e4
Status: Downloaded newer image for ubuntu:latest
```

- Each image layer has its own directory under /var/lib/docker/overlay/.
- This is where the contents of each image layer are stored.
- Directories on the file system

```
$ ls -l /var/lib/docker/overlay/
```

```
total 20 drwx----- 3 root root 4096 Jun 20 16:11 38f3ed2eac129654acef11c32670b534670c3a06e483fce313d72e3e drwx----- 3 root root 4096 Jun 20 16:11 55f1e14c361b90570df46371b20ce6d480c434981cbda5fd68c6ff61 drwx----- 3 root root 4096 Jun 20 16:11 824c8a961a4f5e8fe4f4243dab57c5be798e7fd195f6d88ab06aea92 drwx----- 3 root root 4096 Jun 20 16:11 ad0fe55125ebf599da124da175174a4b8c1878afe6907bf7c7857034 drwx----- 3 root root 4096 Jun 20 16:11 edab9b5e5bf73f2997524eebeac1de4cf9c8b904fa8ad3ec43b35041
```

- The organization of files allows for efficient use of disk space.
- There are **files unique to every layer** and **hard links to files** shared with lower layers

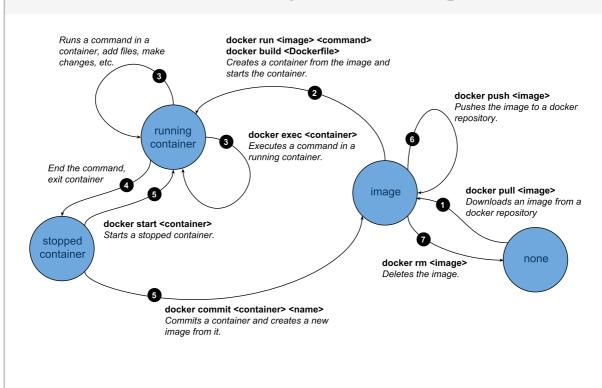

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 31 -

# **Docker Container Lifecycle State Diagram**

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 32 -

# Commands (1)

#### docker version

list current version of docker engine and client

#### docker search <image>

search for an image in the registry

#### docker pull <image[:version]>

download an image of a specific version from the registry if the version is not provided, the latest version will be downloaded

#### docker images

list all local images

#### docker run -it <image[:version]> <command>

start the image and run the command inside the image if the image is not found locally, it will be downloaded from the registry option -i starts the container in interactive mode option -t allocates a pseudo TTY

#### docker ps [-as]

list all running containers option -a will list all containers including the stopped ones. option -s will list the container's size.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 33 -

# Commands (2)

#### docker rm <container>

remove the container

#### docker rmi <image>

remove the image

#### docker commit <container> <name[:version]>

create an image from the container with the name and the version

#### docker history <image>

display the image history

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

– 34 –

# **Networking and Linking**

- There are 3 docker networks by default
  - bridge container can access host's network (default)
    - $\rightarrow$  Docker creates subnet 172.17.0.0/16 and gateway to the network
    - → When a container is started, it is automatically added to this network
    - → All containers in this network can communicate with each other
  - host all host's network interfaces will be available in the container.
  - none container will be placed on its own network and no network interfaces will be configured.
- Custom Network configuration
  - You can create a new network and add containers to it
  - Containers in the new network can communicate with each other but the network will be isolated from the host network
- Linking containers (legacy)

```
$ docker run -d --name redmine-db postgres
$ docker run -it --link redmine-db:db postgres /bin/bash
root@c4b12143ebe8:/# psql -h db -U postgres
psql (9.6.1)
Type "help" for help.
postgres=# SELECT inet_server_addr();
postgres=# SELECT * FROM pg_stat_activity \x\g\x
```

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 35 -

# **Networking Commands**

#### docker network 1s

lists all available networks

docker network inspect <network-id>

Returns the details of specific network

docker network create --driver bridge isolated\_nw
 creates a new isolated network

docker run -it --network=isolated\_nw ubuntu bin/bash

starts the container ubuntu and attaches it to the isolated network

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

#### **Data Volumes**

- Data Volume
  - A directory that bypass the union file system
  - Data volumes can be shared and reused among containers
  - Data volume persists even if the container is deleted
  - It is possible to mount a shared sotrage volume as a data volue by using a volume plugin to mount e.g. NFS
- Adding a data volume

```
docker run -d -v /webapp training/webapp python app.py will create a new value with name webapp, the location of the volume can be determined by using docker inspect.
```

Mount a host directory as a data volume

```
docker run -d -v /src/webapp:/webapp training/webapp python app.py if the path exists in the container, it will be overlayed (not removed), if the host directory does not exist, the docker engine creates it.
```

• Data volume container

```
- Persistent data to be shared among two or more containers
docker create -v /dbdata --name dbstore training/postgres /bin/true
docker run -d --volumes-from dbstore --name db1 training/postgres
docker run -d --volumes-from dbstore --name db2 training/postgres
```

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 37 -

## **Dockerfile**

• Dockerfile is a script that creates a new image

```
# This is a comment
FROM oraclelinux:7
MAINTAINER Tomas Vitvar <tomas@vitvar.com>
RUN yum install -q -y httpd
EXPOSE 80
CMD httpd -X
```

• A line in the Dockerfile will create an intermediary layer

```
$ docker build -t tomvit/httpd:v1 .
Sending build context to Docker daemon 2.048 kB
Step 1 : FROM oraclelinux:7
---> 4c357c6e421e
Step 2 : MAINTAINER Tomas Vitvar <tomas@vitvar.com>
---> Running in 35feebb2ffab
---> 95b35d5d793e
Removing intermediate container 35feebb2ffab
Step 3 : RUN yum install -q -y httpd
---> Running in 3b9aee3c3ef1
---> 888c49141af9
Removing intermediate container 3b9aee3c3ef1
Step 4 : EXPOSE 80
---> Running in 03e1ef9bf875
---> c28545e3580c
Removing intermediate container 03e1ef9bf875
Step 5 : CMD httpd -X
---> Running in 3c1c0273a1ef
```

If processing fails at some step, all preceding steps will be loaded from the cache on the next run.

\_ 41 -

## **Overview**

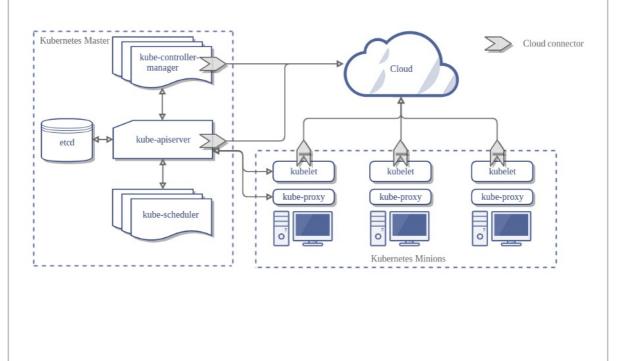

- In your architecture...
  - Containers are atomic pieces of application architecture
  - Containers can be linked (e.g. web server, DB)
  - Containers access shared resources (e.g. disk volumes)
- Kubernetes
  - Automation of deployments, scaling, management of containerized applications across number of nodes
  - Based on Borg, a parent project from Goolge

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 42 -

# **System Architecture**

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 43 -

# **Major Terms**

#### Node

 a worker machine in Kubernetes, previously known as a minion (a VM or physical machine). It uses kubelet and kube-proxy to communicate with the master and other nodes/services.

#### Master

- A node that manages the cluster of nodes.

#### Pod

- The basic building block of Kubernetes, one or more dependant containers.

#### Service

- A set of pods with rules allowing pods to talk to each other, such as:
  - $\rightarrow$  NodePort exposes the pod under a cluster IP.
  - → LoadBalancer exposes the pod for load balancing by external load balancer

#### Controllers

- Worker units to ensure a desired state, such as:
  - $\rightarrow$  ReplicaSet ensures that a specified number of pod replicas are running.
  - $\rightarrow$  Deployment manages ReplicaSets, provides declarative updates to pods.
  - $\rightarrow$  StatefulSet manages deployment and scaling of a set of Pods.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 44 -

#### **Features**

- Automatic binpacking
  - Automatically places containers onto nodes based on their resource requirements and other constraints.
- Horizontal scaling
  - Scales your application up and down with a simple command, with a UI, or automatically based on CPU usage.
- Automated rollouts and rollbacks
  - Progressive rollout out of changes to application/configuration, monitoring application health and rollback when something goes wrong.
- Storage orchestration
  - Automatically mounts the storage system (local or in the cloud)
- Self-healing
  - Restarts containers that fail, replaces and reschedules containers when nodes die, kills containers that don't respond to user-defined health checks.
- Service discovery and load balancing
  - Gives containers their own IP addresses and a single DNS name for a set of containers, and can load-balance across them.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar

- 45 -

## Demo

• Environment Setup

minikube – a local virtual machine (running a master and a single node) kubectl – CLI to access Kubernetes cluster

- Steps
  - create hello-node app in node.js and test it [see server.js] node server.js
  - create docker image for the app [see Dockerfile] docker build -t hello-node:v1.
  - 3. deploy the app to Kubernetes by using kubectl
    kubectl run hello-node --image=hello-node:v1 --port=8080
  - 4. Expose the app as a load balancer service. kubectl expose deployment hello-node --type=LoadBalancer
  - 5. Explore the app in minikube dashboard. minikube dashboard
  - 6. Fire requests at the service and count them [see test.sh] ./test.sh.
  - 7. Change the number of replicas by using the dashboard or kubectl.

Lecture 2: Cloud Architectures, CTU Summer Semester 2017/2018, @TomasVitvar
